**Case Description:** Completed / Regular / X-ray / Specific region(s)

**Case History:**

OFA hip and elbow radiograph evaluation

**Case Report:**

647637 KW/ml

Three digitalized radiographic images containing projections of the pelvis and elbows were submitted for evaluation. The radiographs are dated 10/29/24.

**Radiographic Findings:**

Both femoral heads are located in their respective acetabula with approximately 50% of the right femoral head and greater than 50% of the left femoral head located medial to the dorsal acetabular rims.

Both femoral heads are congruous with the acetabula with slight widening of the medial aspect of the coxofemoral joints.

No osteophyte formation is present on the femoral necks or acetabula.

Alignment of the patellae with the femurs is normal.

Muscle volume in both hind legs is within normal limits.

The anconeal process of both ulnae and proximocranial aspect of both radii are smooth with no evidence of osteophyte formation.

No sclerosis is associated with the ulnar notches.

Both medial coronoid processes are smooth in contour and a fragment associated with the medial coronoid processes is not identified.

**Diagnosis:** Normal pelvis and elbows.

**Comments:** Radiographic changes to suggest elbow or hip dysplasia are not present. Based on the OFA scheme evaluating hips, the hips would be rated as good in conformation. The clinical status of the patient will determine if further assessments of the pelvis and elbows radiographically would be necessary.

# ORTHOPEDIC FOUNDATION FOR ANIMALS, INC.

BEECHWOOD'S MAUI  
*registered name*

HYBRID

11/13/2024  
*date of report*

**RESULTS:**

Normal cardiovascular examination via auscultation - No evidence of congenital or acquired heart disease was noted. Since acquired heart disease may develop later, these evaluation results remain valid for one year, and annual examinations are recommended to continue to monitor cardiac health.
