RESULTS:

Normal cardiovascular examination via auscultation - No evidence of congenital or acquired heart disease was noted. Since acquired heart disease may develop later, these evaluation results remain valid for one year, and annual examinations are recommended to continue to monitor cardiac health.

Case Description: Completed / Regular / X-ray / Specific region(s)

Case History:

Preliminary ofa hip radiograph evaluation

Case Report:

590797 KW/bs

A digitalized radiographic image containing a ventrodorsal projection of the pelvis was submitted for evaluation. The radiograph is dated 3/2/23.

Radiographic Findings:

Both femoral heads are well seated in their respective acetabula with greater than 50% of the left femoral head and slightly greater than 50% of the right femoral head located medial to the dorsal acetabular rims.

Both femoral heads are congruous with the acetabula with mild widening of the medial aspect of the coxofemoral joints.

No osteophyte formation is present on the femoral necks or acetabula.

Alignment of the patellae with the femurs is normal.

Muscle volume in both hind legs is within normal limits.

Diagnosis: Normal pelvis.

Comments: Radiographic changes to suggest hip dysplasia are not present. Based on the OFA scheme of evaluating hips, the hips would be rated as fair in conformation. Radiographs obtained at 2 years of age will need to be evaluated to completely exclude elbow and hip dysplasia and to establish a final rating on the coxofemoral joints.
